Introduction

Since the beginning of the COVID-19 pandemic, many of you have probably felt stressed and anxious about the risks surrounding the disease. Some of you may be dealing with some of the economic and physical challenges caused by COVID. And some of you, who may have enjoyed daily interactions with family, friends, and caregivers prior to the pandemic, may now have limited access to these relationships due to lockdowns and social distancing. The circumstances can leave you feeling alone, scared, stressed, and isolated. So given these challenges and the feelings that come from them, we’ve developed a series of strategies and techniques in this workbook that will help you to overcome the difficulties of the pandemic life. Altogether, our hope is that we can empower you to see the latest chapters in your life as some of the best to come.

Covid-19: A National Health Crisis

These are difficult times for everyone. COVID-19 has impacted all of us in many ways. It is especially difficult for those of us who may not have a strong network of support or are isolated. People, activities and resources that have supported our wellness may have been removed or altered in significant ways. Fortunately, you are a survivor, and this guide is designed to remind you of all the ways you have survived and thrived through difficult life situations. With this in mind, the guide is also asks you to share your skills with others around you, helping them through this tough time. Together, you are NOT alone... you are simply two
people, going through a difficult time and relying on each other’s strength, kindness and skills to continue your journey of wellness! Let’s start by sharing some basic information about COVID-19 and the way it may be impacting our bodies...

**What is Covid-19?**

COVID-19 (also called “Coronavirus 2019”) is a virus that is transmitted from person to person

- Between people who are in close contact with one another (within about 6 feet).
- Through respiratory droplets produced when an infected person coughs or sneezes or even is just speaking.
- These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.

**It’s NEW!!**

The virus is called “Novel” or “new” Coronavirus. **This means that humans don’t have any immunity (biological disease fighters).** Scientists have been able to create a test that can determine if someone has the virus.

**Why the Big Deal?** The “physical distancing” efforts have been important because the virus has some sneaky ways that leads to it spreading easily:
People can carry the virus and spread it to others without having any symptoms themselves. Any of us could be a “silent carrier”, infecting others without even knowing it.

Also, people who get sick may have been carrying and spreading the virus for up to two weeks before having their own symptoms.

This is why there are such dramatic efforts to keep people apart and “physical distancing.”

Some Quick Facts and Myth Busters

Here’s some quick facts and myth busters from the Center for Disease Control (CDC).

Because the virus first emerged in China, rumors started that this was an Asian or Chinese disease. Like all viruses, Covid-19 doesn’t discriminate. It’s called a “pandemic” because it’s now a world-wide illness that has infected about 3 ½ million people as of this writing and growing every day.

Exposure increases your risk of getting the virus. But for some people, the impact of the virus is more likely to be deadly. People at greater risk are:
⇒ People over 65 years old
⇒ People who have pre-existing illnesses, especially lung conditions, heart conditions, diabetes, etc.
Strong bodies can probably fight off the virus so people will get sick but recover. People with weakened bodies can get deathly ill.

Since we can have the virus before we actually get any symptoms, it’s suggested that people “quarantine” for up to two weeks after they know they’ve been exposed to someone with the virus. This is to slow down the spread. As of right now, with what the experts have learned about the disease so far, it’s believed that if a person who was exposed hasn’t gotten any symptoms within two weeks, he or she wasn’t carrying enough virus to infect others and is safe to go back into the community.
The symptoms of Covid-19 are very similar to other common illnesses. Testing is available and you can find out if you do or don’t have the virus. If you’re in a living situation where you don’t have quick access to medical support, but think you might have the virus, it’s probably best to assume you do and take precautions to minimize spreading the illness to others. These are discussed below.

The best way to prevent illness is to avoid being exposed to this virus if it’s possible. Of course, for most people, total isolation from others isn’t possible, and for people currently in living with others like shelters or mental health institutions, it can be more challenging. However, there are some precautions and recommended strategies that can help you minimize your chances of getting the virus.

CAUTION!

Sometimes, we can mistake physical discomfort as caused by stress, but can actually be physical symptoms of COVID-19. If
you have ANY of the following symptoms speak to a medical professional. Before you assume its stress, have it checked out!

- cough
- shortness of breath or difficulty breathing
- fever
- chills
- muscle pain
- sore throat
- persistent pain or pressure in the chest
- new loss of taste or smell

**RECOMMENDED STRATEGIES**

**Washing your hands** with soap for at least 20 seconds is recommended because soap is a great virus killer. The virus often gets into our bodies by traveling from our hands to our face (when we touch our face) and then gets inside our bodies when we breathe. So the more you wash your hands, the more likely you are to kill any of the virus germs you picked up along the way. If soap isn’t available, using a **hand sanitizer** with at least 60% alcohol can also help. Be sure to cover all surfaces of your hands and rub them together until they feel dry.
Avoiding close contact with others when possible is important, especially with people who are sick. In general, putting distance between yourself and other people (at least 6 ft) can lessen your chance of getting the virus. This is particularly important for people who are at higher risk of getting very sick. (see below)

Wearing facemasks is important to minimize the chance that you will infect other people. The Covid-19 virus is dangerous because you can have it and be spreading it without having any symptoms at all. Facemasks provide a barrier for the nose and mouth to either transmit droplets or receive them... it’s protection for everyone!

THINGS YOU CAN DO ANYWHERE

Some people don’t have the ability to follow the recommendations because of limitations posed by experiencing homelessness or living in medical or penal institutions. Here are some alternative ways to keep yourself and others safe.

Can’t Wash Your Hands Often? Try these things you can do anywhere:

Hand washing decreases the risk of carrying the virus from surfaces you touched to your nose and mouth. We tend to touch our faces a lot – way more than we may realize – and this is one of the quickest routes for the virus to carry from person to person. If you can’t wash your hands often, you can still:

- Try to limit how many surfaces you touch. Things like door handles, counters and other smooth surfaces can hold the virus for several days.
• **Use your sleeve over your hands.** When you go through doors or gates or when you pick up something from a counter, use an article of clothing like your sleeve to cover your hand.

• **Try to keep your hands from your face.** This sounds simple, but it’s really hard. Try to pay attention for just 15 minutes, and you’ll see how many times your hand has gone to your face. But if you can’t wash your hands, keeping your hands from your face will dramatically increase your safety.

• **Cover your mouth and nose with your shirt.** When you’re in shared spaces where you can’t keep at least 6 feet between you and others, you might want to pull up your shirt or clothing to cover your mouth and nose to work like a mask.

• **Cough or sneeze into your inner arm or clothing.** When you cough or sneeze, use the inner space of your elbow or a piece of clothing rather than covering your mouth with your hands.

• **Turn your head or cover your mouth.** If someone else is coughing or sneezing in your presence, try to turn your head away from the person (and stay turned for about 30 seconds if you can) or use a piece of clothing to cover your mouth.

Everyone is trying their best to slow the spread and, especially keep the virus from infecting those who are most vulnerable – those who are older and have pre-existing medical conditions, such as COPD, diabetes, heart conditions, HIV, and immune compromised. Testing has become more widely available to people beyond those who are already showing symptoms. Scientists are working feverishly to try to create medications to lessen the symptoms of COVID-19 and
several vaccine options have now been created. The question that many people are asking themselves, **SHOULD I GET VACCINATED?** will be explored in this next section.

**SHOULD I GET VACCINATED? SOME THINGS TO CONSIDER....**

As human beings, our bodies can be quite resilient and withstand a lot of use, wear and tear. Our bodies can also be quite vulnerable to injury, illness, and disease.

When the onset of new diseases such as smallpox, tetanus, tuberculosis, measles, polio and others, began devastating the health and safety of our lives, scientists began discovering ways to create immunity through vaccination. Vaccines are now commonly used for many types of contagious diseases and are routinely used to ensure that children, adults and vulnerable communities remain healthy and immune to diseases that would have once caused serious illness and even death.

**WHAT IS IMMUNITY?**

Simply put, immunity means that you are protected from something that is unwelcome or harmful.
COVID-19 Vaccines

Vaccines (shots) are one of the tools we have to fight the COVID-19 pandemic.

To stop this pandemic, we need to use all of our prevention tools. Vaccines are one of the most effective tools to protect your health and prevent disease. Vaccines work with your body’s natural defenses so your body will be ready to fight the virus, if you are exposed (also called immunity). Other steps, like wearing a mask that covers your nose and mouth and staying at least 6 feet away from other people you don’t live with, also help stop the spread of COVID-19.

Studies show that COVID-19 vaccines are very effective at keeping you from getting COVID-19. Experts also think that getting a COVID-19 vaccine may help keep you from getting seriously ill even if you do get COVID-19. These vaccines cannot give you the disease itself.

The vaccines are safe. The U.S. vaccine safety system makes sure that all vaccines are as safe as possible. All the COVID-19 vaccines that are being used have gone through the same safety tests and meet the same standards as any other vaccines produced through the years. A system in place across the entire country that allows CDC to watch for safety issues and make sure the vaccines stay safe.

Different types of COVID-19 vaccines will be available. Most of these vaccines are given in two shots, one at a time and spaced apart. The first shot gets your body ready. The second shot is given at least three weeks later to make sure you have full protection. If you are told you need two shots, make sure that you get both of them. The vaccines may work in slightly different ways, but all types of the vaccines will help protect you.

www.cdc.gov/coronavirus/vaccines
The vaccines may cause side effects in some people, like sore muscles, feeling tired, or mild fever. These reactions mean the vaccine is working to help teach your body how to fight COVID-19 if you are exposed. For most people, these side effects will last no longer than a day or two. **Having these types of side effects does NOT mean that you have COVID-19.** If you have questions about your health after your shot, call your doctor, nurse, or clinic. As with any medicine, it is rare but possible to have a serious reaction, such as not being able to breathe. It is very unlikely that this will happen, but if it does, call 911 or go to the nearest emergency room.

**When you get the vaccine, you and your healthcare worker will both need to wear masks.**

CDC recommends that during the pandemic, people wear a mask that covers their nose and mouth when in contact with others outside their household, when in healthcare facilities, and when receiving any vaccine, including a COVID-19 vaccine.

Even after you get your vaccine, you will need to keep wearing a mask that covers your nose and mouth, washing your hands often, and staying at least 6 feet away from other people you do not live with. This gives you and others the best protection from catching the virus. Right now, experts don’t know how long the vaccine will protect you, so it’s a good idea to continue following the guidelines from CDC and your health department. **We also know not everyone will be able to get vaccinated right away, so it’s still important to protect yourself and others.**
How Might Covid-19 Affect Us?

STRESS is a natural response to uncertainty and disruption, and so in this time when our entire way of life is disrupted, everyone everywhere is feeling some degree of stress.

We each experience stress in our own unique ways. As we grow up, we learn how to respond to challenges by watching those around us for cues of what is and isn’t acceptable. In addition, our bodies have natural defense mechanisms that signal when things are out of sync and signal our body and mind so we can react to keep ourselves safe. Think about what happens when you startle a dog or cat. Their first reaction is to get into a defensive posture and hiss or bark. In an instant, they’re ready to protect themselves. Humans are much the same way. We also get flooded with chemicals, like adrenaline, that assist our minds and bodies to combat the danger.

Our Internal Alarm: Those of us who have grown up in homes with violence, abuse or neglect may have activated this “danger” alert many times. Over time, parts of our system can get worn out and broken. For some of us, the “alarm bell” goes off often, even when there’s not any danger there. Similarly, our alarm bell may signal a five-alarm fire, when the situation is really only a small amount of smoke. In these cases, our bodies are flooded with overwhelming amounts of “fight or flight” chemicals. We’re ready for a battle that doesn’t exist. For others, the alarm bells might fail to ring when needed, leaving us vulnerable and unprepared to address a danger that may exist.
Our Response to Danger: While some of us respond to our internal alarm by going into a “fight” stance, others of us may respond in the opposite way, “freezing” or “checking out.” This is known as dissociating and is an automatic biological response. In the same way a deer freezes in the middle of the road in fear when a car approaches, we too may go into a freeze mode. This can lead to brain fog, an inability to speak or speak clearly, feeling stuck in place and unable to move, or spacing out. The spacing out, or dissociating, can be mild or more extreme, including total memory loss of the time like a blackout. Here’s another way to look at it, graphically:

**FLIPPING OUR LID**

Make a fist with your thumb tucked inside your fingers. This is a hand model of our brains.

**THUMB**

In this hand model, our fingers represent where our emotions and memories live.

It is called the Limbic System and it is where our Fight, Flight, Freeze reactions to danger are triggered.
FINGERS

In this hand model, our fingers represent our Rational Brain. When our rational brain is activated, we are able to think, reason and make decisions about how we are going to respond to danger. As in the image above, it covers our Limbic System (thumb) and we use it to think through situations.

However, at times when our Limbic System (thumb) is really activated, it can cause us to “flip our lid,” and our rational brain (fingers) can be taken over by our emotions and we can’t think clearly.

To un-flip our lids, we can use the strategies included in this manual to help us ground, calm our bodies and mind, and feel more empowered.

Distress: What YOU Might Be Experiencing

Experts agree that a core component of stress is the perception of threat and danger. Ironically, our “stress” system is meant to protect us when we’re in danger but can sometimes work against us. When we’re under stress, we tend to experience distress in our most vulnerable areas that may be physical, emotional, intellectual and/or spiritual.

Outward Signs of Distress:
Often, when we experience distress, it shows up in our behavior. It’s important to notice our own behavior as a signal that we may be experiencing physical, emotional, intellectual or spiritual distress. Some “behavioral cues” include:

- Repeating old habits or patterns. Do you find that you are tempted to start smoking cigarettes, even though you quit years ago? Picking up old habits as a way to cope is very common and could be a signal to you that you are distressed.
- Lashing out, yelling, throwing things. When our internal distress levels reach a boiling point, we may be tempted to release it out of frustration. This may be a warning sign that it’s time to relieve our stress in healthier ways.
- Pacing, leg shaking, wringing our hands. Sometimes when our nervous system needs to release tension, it does so through our body. Be aware of these stress signals.

As you read these examples, think about what you’ve been thinking or feeling over the past few days or weeks.
Physical Distress

Imagine you’re walking down the street. When you turn the corner, you see a lion staring at you. Right away, your body starts pumping out chemicals that will allow you to do what’s needed to survive. And that’s really good when there’s a lion. But not so good when we’re worried about things going on around us, like COVID-19. Our brains have the same reaction to any kind of “danger,” though, and all those chemicals can cause all sorts of physical discomforts, including:

- Sweaty palms
- Heart fluttering (palpitations)
- Shortness of breath
- Dizziness or headaches
- Tingling in fingers or toes
- Aches and pains (old injuries will often ache again!)
- Muscle tension
- Restlessness
- Digestive issues like diarrhea or constipation
- Nausea

CAUTION!
Sometimes, we can mistake physical discomfort as caused by stress, but can actually be physical symptoms of COVID-19. If you have ANY of the following symptoms, tell the staff where you currently reside. Before you assume its stress, have it checked out!

- Cough
- Difficulty breathing
Think about your body. Describe the physical sensations you have been experiencing over the past few weeks:

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

One strategy: Breathing

**Why this may help:** Normally, we breathe very shallowly, up in our chests. Learning to breathe down into our stomachs naturally helps calm us down. It also brings more oxygen into our body and brain, which helps us think more clearly. Belly breathing before a stressful situation can be very helpful. Here is what you do:
⇒ First, breathe as you normally do
⇒ What parts of your body move as you breathe? Notice what it feels like
⇒ Now, sit and place your hand on your stomach
⇒ With your mouth closed, breathe in for four seconds or until you feel your whole chest fill with air all the way down to your belly
⇒ Hold in the air for four seconds
⇒ Slowly blow all the air out until it’s all gone
⇒ Try this three or four times

Did you notice anything different about how you feel?

______________________________________________________

______________________________________________________

**Intellectual Distress**

When our inner sensors tell us that something isn’t right and we may be in danger, our brains work differently, too. We can think of our brains as being three brains in one. Part of our brain is just dedicated to our survival – it runs our heart, our breathing, etc. A second part of our brain is called our “emotional brain”. This part of the brain rules our emotions and holds our memories. Sometimes our emotions will have words connected to them, and sometimes they’re just feelings with no words. Our third brain is where we do the complex thinking needed for decision making, using judgment, navigating social relationships, etc. It’s this third brain that we rely on most to guide us through the complex nature of living with others in the world. But in times of stress, our third brain steps aside a bit to
allow the survival brains to be more in charge. This can lead to thinking problems, including:

- difficulty concentrating
- difficulty with decision making
- retaining information
- hard time processing information
- less patience with others
- More difficulty managing relationships that are complicated

Think about your OWN THINKING lately. What kinds of thoughts have felt challenging?

One strategy: Sphere of Influence

Why this may help: We all would like to think that we have a lot of control over a lot of things. We don’t! We have even LESS control when we’re in places where others make the majority of the rules, such as prisons, mental health facilities, residential settings, etc.
For those of us with trauma histories – most of us – it can feel real scary to lose our inner sense of control. A lot of times, though, our distress isn’t about the realities around us, but our inner confusion about where we do and don’t have control. Trying to be in control of those things over which we have no power can lead to inner turmoil. One way to help is to figure out what we DO and DON’T have control over. This exercise may help to decrease some of the inner racing thoughts or obsessive thoughts.

**Taking back my Control. (Instructions on next page)**
Instructions:

1. Take a moment to consider all the things that are contributing to your overwhelmed feeling, e.g. limited time to yourself, ongoing worry about someone you care about, feeling tired, you have a cold, etc. If it helps, quickly scribble them down below.

2. Add each 'Overwhelm Item' to your Spheres of Influence in the following way:

   - If you have complete CONTROL over the item (i.e. you can resolve it on your own), write below.

   - If you have PARTIAL control or can INFLUENCE the item (i.e. you can resolve part of the item or influence the outcome through your actions or behavior), write below.

   - If the items are COMPLETELY OUTSIDE of your control or influence (i.e. there is nothing you could do or say that could directly impact this item), write these items below.
If you think of other things that are overwhelming you as you do this exercise, add those into the box as you did above.

From your "Spheres of Influence" that you created:

⇒ FOR the items you have CONTROL over, TAKE ACTION (however small) on at least ONE as soon as possible – it will help you feel better.

⇒ FOR the items you have PARTIAL CONTROL or INFLUENCE over, write down the steps you can take and when you might be able to do that.

⇒ Finally (and most importantly) LET GO of EVERYTHING ELSE!
   Strikethrough each of these items on your "Spheres of Influence." If you can't control or influence it, then it's a waste of your precious energy to even think about it.

Here’s a familiar quote that may help. (Feel free to replace the word “God” with whatever works for you!)
GOD GRANT ME THE
SERENITY
TO ACCEPT THE THINGS
I CANNOT CHANGE
COURAGE
TO CHANGE THE
THE THINGS I CAN AND
WISDOM
TO KNOW THE DIFFERENCE
Emotional Distress

For the general public, the mental health effects of COVID-19 are as important to address as the physical health effects. For the one in five who already have mental health challenges, the emotional impacts can be even greater. Those of us that are separated from friends and family due to being in jails, prisons, hospitals, shelters or other facilities, may be feeling additional levels of emotional disconnection and distress during these times. As a result, you may be feeling:

- Constant worry or anxiety
- Overwhelmed
- Difficulty relaxing
- Confusion
- Sense of being overwhelmed
- Feeling powerless
- Mood swings
- Feelings of hopelessness
- Irritability or short temper
- Fear and worry about your own health and the health of your loved ones
- Changes in sleep or eating patterns
- Difficulty sleeping or concentrating
- Worsening of chronic health problems
- Worsening of mental health conditions
- Increased use of alcohol, tobacco or other drugs.

Think about your OWN Emotions. What kinds of emotions have you been feeling? Have you noticed other things that let you know that you’re feeling emotional stress?
One strategy: Journaling

Why this may help: Thinking in writing has this magical quality of clarifying your thoughts. Research has shown that spending time to write out our thoughts or feelings - the essence of Journaling - can help with clearing out our thoughts, leading to better decision making. Personal writing can also help with coping, especially during stressful events like dealing with COVID-19 and can help relieve anxiety and boost immune cell activity.

What you write, you control. Getting thoughts from the inside of your mind to paper can help you tap into what lies beneath - what is important to you, what is really fueling the distress and potential ways you may want to move forward.
Journaling Exercise - The 5 Minute Journal

People have been journaling for centuries, and journals vary dramatically person-to-person. What you may find useful in a journal is personal and unique to you. The hard part of learning if or how journaling may feel helpful is simply getting started if you haven’t journaled before.

Perhaps the best way to try it out is to start small and just focus on your thoughts.

Directions:

● Put aside 5 minutes each morning and evening to journal.
● Start your journaling each morning and evening answering these two simple questions:
  ○ What am I feeling right now?
  ○ Do I know why?
● Write down any thoughts/feelings that you become aware of. (Just write them down without censoring them or judging them - they just are.)
● Keep writing for 5 minutes. If you want to stop, stop. If you want to keep writing and add other themes to your writing, feel free to do that.

Your journaling is not your performing for history. It’s you reflecting. It’s you working through your problems. It’s you figuring things out and clearing your head. Write about the maddening, frustrating people you encountered today. The comment, the tweet, the news headline that made you furious. Write about the wounds you still carry from childhood. The person who didn’t treat you right. The terrible experience. The parent who was just a little too busy or a little too critical or a little too tied up dealing with their own issues to be what we needed. The
sources of anxiety or worry, the frustrations that routinely pop up at the worst
times, the reasons you have trouble staying in relationships, whatever problem
you are dealing with—take them to your journal. You’ll be shocked by how good
you feel after.

*Leave Your Destructive Thoughts in Your Journal*

Note how this makes you feel:

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

(You might want to try it a few times before deciding for sure if this is helpful or
not. *The first time or two can just feel awkward because it’s something new. But
by the third time, you should have a pretty clear idea how you feel during or after
deep breathing.*)
Journaling Exercise – Life Story

Another useful journaling technique is the “life story”. As the name suggests, we encourage you to look at your life like a story in a novel. In doing so, here are some the questions that you’ll want to answer:

- What are the major life events, “Chapters”, in your life’s story?
  - This could include marriage, education, birth of a child, major career moments, etc.
- What would the chapters include?
  - Think about all the funny and wonderful things that led up and happened in the chapter of your life.
- What does the next chapter of your story look like? And what does it include?
  - Perhaps it is spending more time with your relatives and friends. maybe it is a learning a new hobby or reading that book you always wanted to read.

Altogether, whatever you put in your life story, remember that the primary purpose is to help you put your life into perspective and remember the things that matter the most in your life.

Spiritual Distress

Our spiritual wellbeing is important to our physical and emotional wellbeing. When we’re feeling stressed, there’s a good chance that our spirit may be as
impacted as our body and mind. This is true whether you meet your spiritual needs through religious participation or any other ways, such as visiting nature, meditating, etc. In these times, it’s common to experience a spiritual vacuum with the following feeling or thoughts:

- A weariness of the heart
- A sinking feeling that nothing really matters
- Questioning beliefs that were once unquestionable, like “Does God even exist?”
- Wondering about the meaning or purpose of life.
- Wondering about your own value in the world.
- A sense of deep grieving

Spirituality is often a sense of connection to a bigger picture, individually defined, that gives meaning and purpose to a person's life.

Think about your OWN spiritual center. What questions are you asking yourself that indicate that your spirit is feeling overwhelmed?
One strategy: Filling Your Heart

Why this may help: Heart weariness can leave us feeling empty, depleted, exhausted. When we’re in this space, our defenses can be lowered, giving our negative self-thoughts more volume in our heads. Sometimes, the only way to quiet those voices that bring us to darkness and despair is to intentionally sit down and think about those things which are meaningful to us, and “heart-warming.”

Instructions: On the next page, there’s a heart, waiting to be filled. Close your eyes for a moment and start to think about those things that bring you joy in life. Here are some general themes to prompt ideas:

- People you love and hope to see or talk to when lock-downs and other restrictions are lifted;
- People you love and feel committed to, even if your efforts have to be delayed due to incarceration, emotional struggles at the moment, etc.;
- Things you’ve done that your proud of;
- Hopes and dreams for the future;
- Places you’ve been that bring you peace, like the ocean or the mountains or a special trip you got to take;

And remember...you deserve to feel OK!
Self-Help Strategies

There are many self-help strategies circulating to help people deal with the physical, emotional, intellectual and spiritual impacts of living through COVID-19. These are mostly targeted to people with easy access to support networks, can make choices about where they go and when, and have the resources to get books, movies and other distractions to help ride through this time of uncertainty. In the following pages, this workbook modified these strategies to suit the particular needs of older populations.

Some helpful strategies to look at may include such things as being a part of a book club or having walking partners, to help avoid spending too much time by yourself. We know that too much time alone can lead to both mental and physical health problems. In addition, getting outside more often helps to raise your mood and also provides exercise while promoting healing through safe social interactions. You can try calling a friend or family member or even connecting on video-calling platforms, such as Skype and FaceTime, if you have the know-how. This helps by providing warm, comforting, social supports by video, phone, or text. Lastly, before going to bed, it is important to unplug and ready yourself for a restful night. The first thing to do is to say goodbye to all COVID-19-related news. We suggest: 1-2 hours prior to bed, unplug from email, news, and anything else that creates a busy mind and begin focusing on creating a calm, relaxing environment. Turn down your lights and do things that are relaxing to you. Relaxing activities may differ person to person, but often includes reading or
listening to music. You should avoid drinking alcohol close to your bedtime and try not to drink caffeinated drinks after noon.

These strategies will also be divided into the categories of:

⇒ Strategies to help with physical distress
⇒ Strategies to help with emotional distress
⇒ Strategies to help with intellectual distress
⇒ Strategies to help with spiritual distress

STRATEGIES TO SUPPORT GREATER PHYSICAL WELLBEING

Why breathing may help: Breathing is often a way to trigger our own internal “relaxation response.” The great thing about breathing is that we do it all the time and we can do it anywhere. The way we breathe, though, can either add to our sense of stress or diminish it by switching off our “fight or flight” response. When we feel stressed, we often “shallow breathe.” This can add to light-headedness, dizziness and other physical discomforts. Deep breathing, on the other hand, can often center us and help us feel more grounded. (For a small group of people, breathing exercises can actually cause greater anxiety, so always trust your own response. If you’re feeling more anxious, stop and try something else!!)

Post-traumatic stress can affect the way you breathe. Holding your breath, as well as breathing rapidly or shallowly can sometimes lead to chronic anxiety. Awareness and regulation of the quality of our breathing can have several
positive effects. Slowing and deepening our breath allows for adequate intake of oxygen and output of carbon dioxide, both of which are necessary for physical well-being. Conscious breathing during times of distress can allow us to release muscular and emotional tension, reducing our level of distress. Focusing awareness on our breathing can shift our thoughts away from nonproductive or negative thinking and bring us fully back into the present.

On the next few pages, there are a variety of breathing exercises. Try them out and see if they’re helpful for you.

**A simple deep breathing exercise**

**Breathe in through your nose, counting silently** 1, 2, 3, 4 as you inhale.

**Breathe out through your mouth, counting silently** 1, 2, 3, 4, 5, 6, 7, 8 as you slowly exhale.

**Repeat breathing and counting two more times.**
Belly Breathing

Normally, we breathe very shallowly, up in our chests. Learning to breathe down into our stomachs naturally helps calm us down. It also brings more oxygen into our body and brain, which helps us think more clearly. Belly breathing before a stressful situation can be very helpful. Here is what you do:

Note how this makes you feel:

(You might want to try it a few times before deciding for sure if this is helpful or not. The first time or two can just feel awkward because it’s something new. But by the third time, you should have a pretty clear idea how you feel during or after deep breathing.)
⇒ First, breathe as you normally do.
⇒ What parts of your body move as you breathe? Notice what it feels like.
⇒ Now, sit and place your hand on your stomach.
⇒ With your mouth closed, breathe in for four seconds or until you feel your whole chest fill with air all the way down to your belly
⇒ Hold in the air for four seconds.
⇒ Slowly blow all the air out until it’s all gone.
⇒ Try this three or four times.

Note how this makes you feel:

(You might want to try it a few times before deciding for sure if this is helpful or not. The first time or two can just feel awkward because it’s something new. But by the third time, you should have a pretty clear idea how you feel during or after deep breathing.)

90 SECOND STRESS BREAK

1ST 30 SECONDS:
Notice your breathing.
See if you can make your inhale longer than your exhale.

2ND 30 SECONDS:
Keep breathing slowly.
Notice any muscles in your body that are tense.
On each exhale, see if you can relax the tense places.

**LAST 30 SECONDS:**
Keep breathing slowly.
With each breath, say something positive to yourself, such as:
“I got this.” “Keep going.” “I can do this.”
When the 90 seconds are up, go about your day!

Note how this makes you feel:

________________________________________________________________________

________________________________________________________________________

*(Again, you might want to try it a few times before deciding for sure if this is helpful or not. The first time or two can just feel awkward because it’s something new. But by the third time, you should have a pretty clear idea how you feel during or after deep breathing.)*

**HERE’S ANOTHER ONE TO TRY:**
TAKE 5

Use your pointer finger to trace your other hand

Breathe in through your nose

Breathe out through your mouth

Breathe in through your nose as you trace up your finger; breathe out through your mouth as you trace down.

Start

End
Note how this makes you feel:

(Again, you might want to try it a few times before deciding for sure if this is helpful or not. The first time or two can just feel awkward because it’s something new. But by the third time, you should have a pretty clear idea how you feel during or after deep breathing.)
STRATEGIES TO SUPPORT GREATER emotional WELLBEING

Why using your senses helps: Often, emotional distress comes from getting caught into our “emotional brain.” When we’re caught in our emotional brain, we’re often disconnected from our thinking brain that helps us to understand our emotions or cope with our emotions. Using our senses can help us tap back into our upper brain to help us deal with emotions that may be overwhelming us.

Our Five Senses:

This technique will take you through your five senses to help remind you of the present. This is a calming technique that can help you get through tough or stressful situations.

Take a deep breath to begin.

LOOK: ⚫️⚫️

Look around for five things that you can see and say them to yourself in your mind. For example, you could say, “I see the chair. I see the cup. I see the picture frame....”

FEEL:

Pay attention to your body and think of four things that you can feel and say them quietly in your mind. For example, you could say, “I feel my feet in my socks, my hands in my lap, the hair on the back of my neck, and the chair I am sitting on.”

LISTEN:

Listen for three sounds. It could be the sound of cars outside, the sound of a clock ticking, or the sound of your stomach rumbling. Say the three things to yourself in your mind.
**SMELL:**
Name two things you can smell. If you can’t smell anything, then just think of and imagine your two favorite smells.

**TASTE:**
Say one thing you can taste. It may be the toothpaste from brushing your teeth or your tongue in your mouth. If you can’t taste anything, then think of your favorite thing to taste.
Peer to peer support is all around us! It has been around since the dawn of time. As people, we are hardwired to CONNECT. It’s in our DNA…. In times of stress and distress, we also tend to feel comforted most by those who can say, “Ah…yes…I’ve been there, too. You’re not alone.” Likewise, if we’ve been through something ourselves, we often feel a special compassion for those struggling with problems that we’ve also faced and may even have the urge to reach out a helping hand.

“Walking a mile in someone else’s shoes isn’t as much about the walk or the shoes; it’s to be able to think like they think, feel what they feel, and understand why they are who and where they are. Every step is about empathy.”

Toni Sorenson

Here’s a few examples:
- A first-time mom gets support at church from another mom with several children.

- A person hears that his co-worker lost his son in a car accident. He reaches out to the person because he also lost a child and wants to offer support.

- Someone that just had a heart attack, receives support and “lessons” learned from another person that recovered from a heart attack a year earlier.

- A widow turns to another man for support that lost his wife too. The amazing thing about people is that, even when we’re struggling, we reach out and care about others. Humans actually derive pleasure from helping others.

Connection is the energy that exists between people when they feel seen, heard and valued; when they can give and receive without judgment; and when they derive sustenance and strength from the relationship.

-Brene Brown
Did You Know?

Peer support can be formal, such as Certified Peer Specialists who work in our mental health, substance use and judicial systems. But you don’t have to be a Certified Peer Specialists to DO peer support. As a matter of fact, peer to peer relationships have existed way before “formal” peer support, in professional settings with specialty trained and certified Peer Specialists

What we know is that reaching out to others makes US feel better and can help US cope better with our own stress. In Peer Support we understand each other because, although everyone has their own unique stories, we have similar experiences that can create a bond that allows us to learn together, figure out how to change the way we do things and the way we think, and to figure out how to move forward in our lives.
In many professional settings, people are called “experts” due to their educational background, or years working in a profession. In peer support, we are sometimes referred to as “Experts by Experience” because our knowledge and wisdom comes from surviving difficult situations.

When we consider experiences such as hospitalization, substance use, homelessness, loss of loved ones, loss of health, loss of a life role, and suicide attempts to name a few, imagine what it would be like to receive support from someone else that has similar experiences. You may already know some of these people where you currently are living... perhaps YOU are that person that reaches out when new people come. These are examples of Peer Support and have proven to be an incredibly effective way to support, connect and heal together.

The irony is that it’s US that frequently feels better when we support others!
Peer Support is different from the support you get from counselors, doctors and case managers. It is more than just being friends. In Peer Support you understand each other because, although everyone has their own unique stories, you have similar experiences that can create a bond that allows you to learn together, figure out how to change the way you do things and the way you think, and to figure out how to move forward in your lives. By sharing your experiences and building trust in each other, you learn to go forward in new ways that move you away from seeing yourself as “mentally ill” and the limitations of such a view. In Peer Support, you can safely try out new ideas and new ways of being through “learning” rather than a “treatment.”

Mary Ellen Copeland

WHAT IS PEER SUPPORT?

Broadly defined, “peer support” refers to a process through which people who share common experiences or face similar challenges come together as equals to give and receive help based on the knowledge that comes through shared experience (Riessman, 1989). A “peer” is an equal, someone with whom one shares demographic or social similarities. “Support” expresses the kind of deeply felt empathy, encouragement, and assistance that people with shared experiences can offer one another within a reciprocal relationship.

Broken down to its simplest description, peer support is utilizing your own personal experiences to provide support, guidance, and mentoring to those who are experiencing difficulties, similar to your own.

Receiving and offering support can increase our awareness and give us the strength and courage to get through difficult circumstances like
COVID-19. However, to offer support, we have to understand each person’s definition of support varies. Let’s start with your experience:

*In your personal experience, how would you define support?*

___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________

*What types of relationships have been supportive in your recovery? What made them supportive?*
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________
___________________________________________________________________

*What types of relationships were unsupportive? Why?*
___________________________________________________________________
___________________________________________________________________

*How could you find out what support means or “looks like” to your roommate, cell mate or someone that is around you right now?*
What could you do to provide support to your cellmate, etc. or engage someone else that you feel in this kind of discussion?

Peer to Peer Relationships: The Foundation

Healing and Recovery

*We are survivors! People that have been through some of life’s most difficult situations know all about healing and recovery. We are living examples of both and therefore, in our peer relationships, believe and share that healing and recovery is possible for everyone. We support the health and wellness of others in all of our interactions.*

Mutuality

*We believe in mutuality, equality and shared power and do not attempt to have power over others. In peer to peer relationships, we are equal and do not attempt to advise or have authority in the relationship. Instead, we recognize that mutual relationships can be healing to both individuals.*

Hope

*We inspire hope, courage and/or confidence. Hope is a vital component of wellness. Without hope, why would anyone try to improve his/her situation or live his/her life? Hopelessness*
keeps people in a dark place with no plans or energy to move forward. In peer relationships, we serve as a living example of hope. Our lived experience and resilience demonstrate to others the hope of recovery!

**Empowerment**

We seek to bring out the power within the other person by encouraging him/her to develop solutions to their own challenges and have the confidence in themselves to make decisions. We do that by supporting people to “find” and “use” their voice, to discover who they are and who they want to be, and by exploring all of their options, without judgement, shame, blame or guilt.
Conclusion

PEOPLE WILL FORGET WHAT YOU SAID.
PEOPLE WILL FORGET WHAT YOU DID.
BUT PEOPLE WILL NEVER FORGET HOW YOU MADE THEM FEEL.

Maya Angelou
